Accessories for Kinexus Rheometers

Environmental Controllers, Plates, Cups, Bobs
and Special Accessories

Analyzing & Testing

Introduction

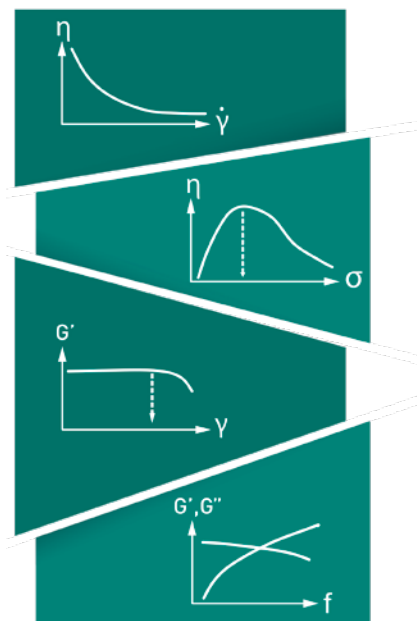

Kinexus Rheometer Series

The Kinexus series of rotational rheometers are class-leading instruments, possessing custom air bearings which are incredibly sensitive to measuring small material differences. The exceptional torque sensitivity provides the ability to measure materials under 'at rest' conditions, enabling determination of product performance such as stability and shelf-life. The unique axial capabilities of Kinexus provides further insight into your material properties. The modular design, combined with its intelligent software provides you with a user friendly, interactive experience.

Accessories for Kinexus Rheometer Series

The Kinexus rotational rheometers are designed as multifunctional solutions which are easily adapted to suit your needs, addressing a wide range of applications.

The wide variety of measurement geometries are optimized for rheological characterization of complex fluids and soft solids, including dispersions, emulsions, polymer and surfactant solutions, pastes and gels.

Cups and Bobs

Special Accessories

EasySwap Temperature Cartridges

Designed for the Rheological Testing of Complex Fluids and Soft Solids

- All *EasySwap* cartridges are compatible with the complete Kinexus suite of rotational rheometers
- Unique plug and play cartridge design
- Quick, easy and robust insertion
- Featuring mechanical, power, communication and fluid connections in one action
- Automatic cartridge recognition and configuration
- Peltier-based systems provide high heating and cooling rates with excellent temperature stability
- High accuracy temperature sensor in close proximity to the sample
- Temperature resolution to 0.01°C
- Easy-to-clean designs

Peltier Plate Cartridge

Environmental controller for cone-plate and parallel plate measuring systems

- Temperature range: -5°C to 200°C, or from - 40°C with active heat exchanger
- Meets the temperature control requirements for a wide range of applications from fluids such as water-like samples to soft solids, such as putty or elastomers
- Interchangeable lower plates enable optimal geometry choice, e.g., matching lower pedestal diameter for self-supporting samples, without compromising thermal performance
- Efficient solvent trap design for accurate measurement of samples with volatile components and to minimize sample drying
- Disposable plate option for curing materials

Peltier Plate Cartridge		
Name	Remarks	Order Number
Entry Level Peltier Plate Cartridge	Maximum temperature of 150°C	KNX2001-E
Peltier Plate Cartridge	Maximum temperature of 200°C	KNX2001

Active Hood Cartridge

The best temperature control system designed to eliminate thermal gradients

- Temperature range: -5°C to 180°C, or from -40°C with active heat exchanger
- Applicable for measuring highly thermal sensitive samples, including temperature critical testing where the temperature range is significantly above or below ambient
- Proprietary design combines Peltier elements with additional heaters to actively control radial and vertical thermal losses, from the local sample environment
- Low thermal mass components for rapid response
- Inlet for inert gas feed into sample environment
- Resolution 0.01°C, stability better than +/- 0.1°C
- Interchangeable lower plates enable optimal geometry choice, e.g. matching lower pedestal diameter for self-supporting samples, without compromising thermal performance
- Disposable plate option for curing materials

Active Hood Cartridge		
Name	Remarks	Order Number
Entry Level Active Hood Cartridge	Maximum temperature of 150°C	KNX2007-E
Active Hood Cartridge	Maximum temperature of 180°C	KNX2007-X

Peltier Cylinder Cartridge

Environmental controller for concentric cylinder-type measuring systems

- Temperature range: 0°C to 200°C, or from -25°C with active heat exchanger
- Temperature control for materials from highly fluid-like samples through to high concentration yield stress dispersions
- Twin Peltier design for rapid temperature changes and sample equilibration and minimized thermal gradients
- Various cup and bob sizes are available – C14 (DIN), C25 (DIN) and wide diameter C34
- Double gap cell, Mooney Ewart and vane tools
- Optional interchangeable lower cups with removable base for ease of cleaning
- Universal Peltier option to enable parallel plate and cone and plate measurements

Peltier Plate Cartridge		
Name	Remarks	Order Number
Entry Level Peltier Cylinder Cartridge	Maximum temperature of 150°C	KNX2002-E
Peltier Cylinder Cartridge	Maximum temperature of 200°C	KNX2002

High Temperature Cartridge Prime

Cutting-edge temperature control in HTC Prime, inspired by thermal analysis technology

- Temperature range: 5°C to 450°C
- Boost cooling for time-efficient sample management
- Homogeneous sample temperature distribution through optimized forced convection and conductive heating
- Smart cooling air control for perfect sample temperature homogeneity
- Thermally optimized design with low thermal mass and isolation
- Suitable for cone-plate and plate-plate geometries up to 40 mm in diameter, ability to purge with Nitrogen gas
- Active thermal management system

HTC Prime	
Name	Order Number
HTC Prime	RHR000KIA84.000-00

Parallel Plates

Parallel Plates can be used for measuring a wide variety of materials from low viscosity liquids to such as more viscous samples: gel-like materials, soft solids, polymeric and reactive systems.

Tips and Tricks

The simple flat upper and lower parallel plates are available in various materials, diameters and surface finishes, and are incredibly versatile.

- **Size** – ranging from 4 mm to 60 mm in diameter as standard. The wide range of plate sizes is available to accommodate materials with different viscosities. The smaller geometries are for suitable for high viscosity samples and the larger geometries (>50 mm), for low viscosity (<0.1 Pa·s) materials.
- **Surface finish** – can be smooth, roughened or serrated. Different surface finishes are available to accommodate those stubborn samples! Emulsions and slurries, for example, may be prone to slippage. This manifests itself as an early drop in viscosity during a shear rate measurement. If a sudden decrease in viscosity during a measurement occurs and slip is suspected, swap to using a geometry with a roughened surface finish. This modified surface interface provides extra grip to encourage the material to flow.
- **Measuring gap** – can be changed with parallel plates between 0.05 mm to greater than 2 mm in height. This flexible feature means that gaps can be tailored to match the samples' viscosity (i.e., smaller gaps for lower viscosity samples) and to achieve different shear rates. Smaller gaps subject samples to higher shear rates (for the same angular velocity), whilst larger gaps will only achieve lower shear rates. As a compromise for the modifiable gap with these measuring systems, an average shear rate is applied to the sample and therefore, results are not absolute (as with cones and plates). In addition, as a general rule of thumb, if particles are present, select a measuring gap of at least 10 times larger than the largest particles. An appropriate gap size will prevent jamming (and potential geometry damage) for larger, solid particles and also provides sufficient interactions to eliminate wall effects, which will cause artefacts in the results.
- **Materials** – the standard geometries on offer are made of stainless steel (SS316L) which is ideal for most laboratory environments as they are compatible with a wide range of sample types and can easily be cleaned with solvents. However, in some circumstances when working with acidic samples, a polymeric geometry such as PEEK or acrylic may be more suitable. The added advantage is that these are lighter and hence useful for high-frequency oscillation measurements on low-viscosity samples. In addition, titanium, aluminum and hastelloy steel geometries are also available.

Upper Cones

Tips and Tricks

Cone and plate combinations consist of a flat lower plate with an upper geometry featuring a truncated cone. Measurements with these geometries are performed at a set gap (automatically controlled by the software). This is to allow for absolute viscosity measurements, where the whole sample is subjected to the same shear rate – a significant advantage over parallel plate geometries which have a range of shear rates across their radii and just the average is reported. There are a variety of materials and surface finishes to select from, e.g. roughened to prevent sample slippage.

Cone angles

- The upper geometry angle can vary from typically 0.5° to 4° . The selection allows you to select your cone choice to achieve different shear rates. The smaller the cone angle, the higher the achievable shear rate. However, the presence of particles (and size) still needs to be considered.
- Cone and plates have a fixed (nominal) measuring gap; for a 1° cone, the gap is 30 microns; 70 microns for 2° cones and 150 microns for 4° . Particles ideally need to be at least 5 times smaller than these gaps to prevent jamming at the apex of the geometry. This can be a particular limitation for the use of cones with particulate dispersions considering the small truncation gap. Plate geometries are more suitable for highly filled samples as the measuring gap can be changed to accommodate for this. If no particles (or very small particles) are present, then no worries!

Cups and Bobs

Cup and bobs, also known as concentric cylinders or coaxial cylinders, are used to typically measure the viscosity of free flowing liquids up to yielding fluids. Diameters typically range from 14 mm to 37 mm. Due to the in-built intelligent geometry recognition in the upper bob, not only are they recognized by Kinexus, they are also automatically configured ready for measurement. The majority of cups and bobs are designed to the DIN53019 standard.

Tips and Tricks

Cup and bob geometries consist of a lower cup, to accommodate the sample, and an upper bob, to measure it. They are useful for lower viscosity samples because the extra surface area enhances sensitivity. The relatively large gap between the upper bob and wall of the lower cup is advantageous by preventing jamming of samples with larger particles. However, as true for any low viscosity materials measured with larger gaps, one needs to be cautious of the onset of Taylor (non-shear) flow influencing the results. This can be detected as a false increase in viscosity at higher shear rates. Cups can be selected with fill lines for ease of sample loading and with removable bottoms enabling easier cleaning between measurements. Similar to the other rheological measuring systems, there are options for different surface finishes and materials.

- **Surface finish** – for those challenging samples prone to slippage, measuring with a roughened or splined (~1 mm vertical grooves) cup and bob is recommended. If particles are present in the sample and sedimentation occurs, a spiralled bob may help slow or prevent the dispersion from settling during the measurement. If the dispersion is very unstable, then using a paddle will be more effective.
- **Vane tools** – are useful for measuring samples with very delicate structures such as foams or soft solids possessing a yield stress. The shape of the vane (as shown opposite) lends itself to slicing into the sample without disturbing or destroying too much of the structure prior to measurement (in comparison to a solid bob).
- **Double gap** – for extremely low viscosity samples, these geometries are a valuable option. The upper bob is hollow, providing an extra measuring surface area and consequently, increases sensitivity. The use of these geometries is recommended for more volatile samples due to the relatively large volume requirements. Another tip for measuring volatile samples is to use a passive solvent trap (KNX2513).

Special Accessories

The modular design of Kinexus enables complete flexibility of accessory configuration with different cartridges and other options. The multi-functional accessory design provides a cost-effective solution allowing interchangeable upper and lower geometries, covering a wide application range.

The Kinexus incorporates a quick-connect engagement mechanism, intelligent auto geometry recognition and intuitive software guidance providing user feedback and easy to use interactive support.

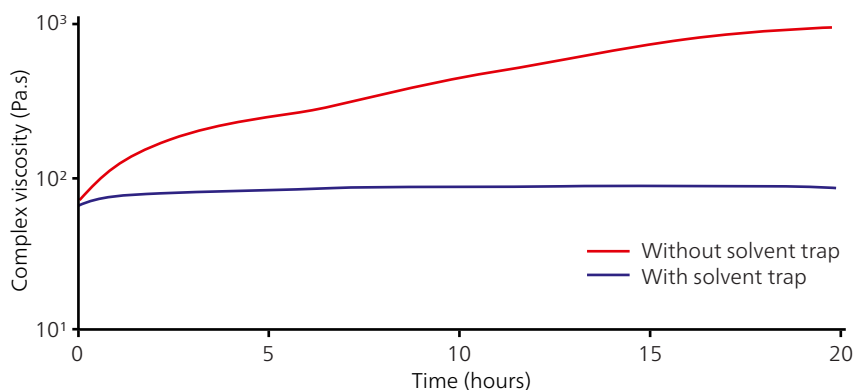

Solvent Trap

The Kinexus solvent trap is an essential accessory when working with volatile samples prone to evaporation and drying. Providing thermal insulation from ambient conditions, the passive solvent trap KNX2513, also allows atmospheric gases to be purged across the sample via gas inlets. KNX2513 is compatible with both plate and cylinder cartridges. For measurements with an active hood cartridge the low profile KNX2514 should be used.

Name	Remarks	Order Number
Passive Solvent Trap	<p>Cartridge Compatibility: KNX2001, KNX2001-E, RHR000KIA84.000-00, KNX2002-E and KNX2252</p> <p>Includes: Stainless Steel upper solvent reservoir, stainless steel thermal cover system, reservoir positioning tool and purge gas kit</p> <p>Upper geometry diameter range for use with passive solvent trap cover: 4 mm - 60 mm</p> <p>Requires a lower plate with solvent trap</p>	KNX2513
Active Solvent Trap	<p>Cartridge Compatibility: KNX2007-X and KNX2007-E</p> <p>Includes: Stainless Steel upper solvent reservoir and stainless steel covers</p> <p>Upper geometry diameter range for use with active solvent trap is 15 mm - 60 mm</p> <p>Requires a lower plate with solvent trap features (see pages 12 and 13)</p>	KNX2514

Solvent Trap

- Prevents evaporation
- Controls the atmospheric gas
- Thermal insulation from ambient conditions

Application example: tomato ketchup. After the initial thixotropic rebuild of the sample, the solvent trap prevented drying by evaporation for up to 20 hours. A significant increase in viscosity can be observed for the measurement conducted without the solvent trap.

Solvent Trap (KNX2513)

Universal Container Holder

The universal container holder enables sample testing within a petri-dish, custom container or beaker, particularly useful when analyzing delicate samples or where disturbance of structure should be avoided. This accessory allows the measurement of samples within their own containers, important for inherently thixotropic and/or set materials and gels (e.g. yoghurts). The testing is carried out under ambient conditions. The universal container is multi-functional, also serving as the base for the texture analysis accessory.

Universal Container Holder

Version	Remarks	Order Number
Plate Version	Cartridge Compatibility: Peltier-Plate Cartridge (KNX2001 and KNX2001-E)	KNX0149
Cylinder Version	Cartridge Compatibility: Peltier-Cylinder Cartridge (KNX2002 and KNX2002-E)	KNX2277

Universal Container Holder

- Sample containers can be loaded directly onto the instrument
- Eliminates unnecessary material handling
- Eliminates unwanted sample perturbation

Universal Container Holder for a plate cartridge (KNX0149)

Texture Analysis

Texture analysis seeks to quantify various physical properties such as hardness and brittleness resilience by driving a measurement probe into a sample at a specific rate, with optional cyclic analysis.

3 Point Bend Kit

This texture analysis pack enables Kinexus to carry out classic 3 point bend tests on solid materials. The sample is bridged over two Aluminum lower triangular prisms mounted onto a Universal Container Holder (KNX0149 or KNX2277) to allow the distance between the prisms to be adjusted. The third prism / point is connected to the Universal Upper Geometry (KNX0095) to drive down onto the middle of this solid sample. Depending on the material a resistance-to-bend or required force-to-break can be measured at room temperature.

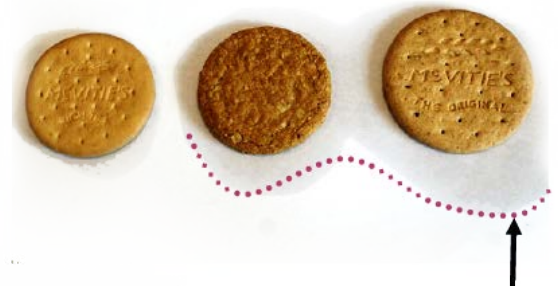

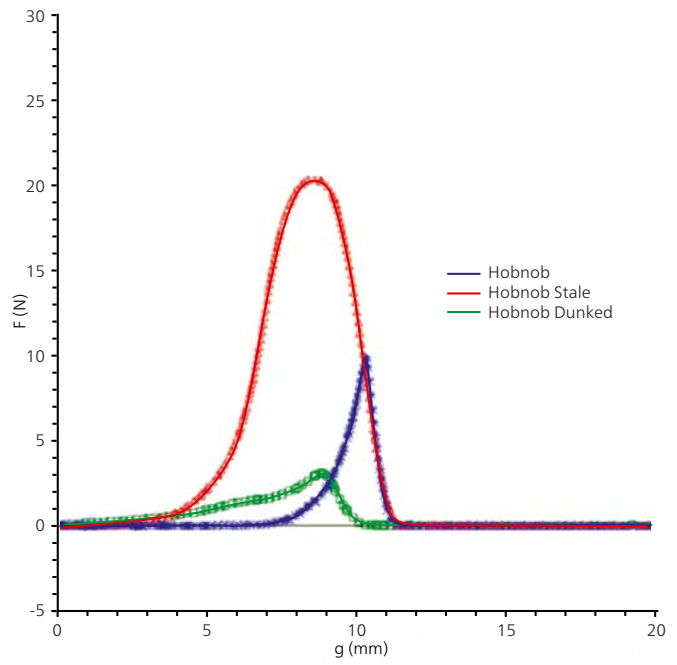

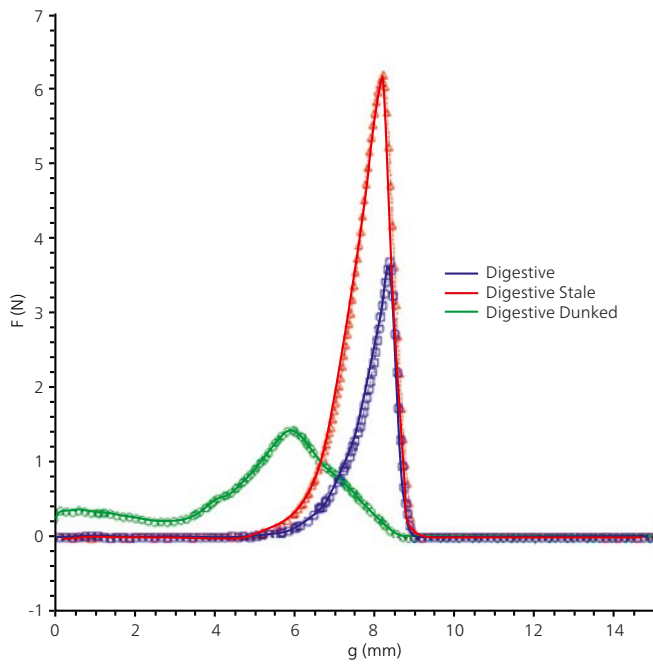

3 Probe Pack

This texture analysis pack is a collection of three (one hemisphere, one 70° cone, one 35° cone) probes for connection to a Universal Upper Geometry (M4 threaded). Typically a semi-solid sample with a thickness around 5-10 cm is placed onto a standard plate cartridge and the force required to penetrate into the sample is measured. The measurements are carried out at room temperature with the option of different probes for varying material stiffness.

Options for Texture Analysis			
Version	Material	Remarks	Order Number
Kinexus Texture Analysis Pack 3 Point Bend Kit	Aluminum	Cartridge Compatibility: KNX2001, KNX2001-E, KNX2002 and KNX2002-E Requires Universal Upper Geometry M4 (KNX0095) and either Universal Container Holder Plate Version (KNX0149) or Universal Container Holder Cylinder Version (KNX2277)	KNX2292
Kinexus Texture Analysis Pack 3 Probe Pack	Aluminum	Cartridge Compatibility: KNX2001, KNX2001-E, KNX2007-X, KNX2007-E Requires Universal Upper Geometry M4 (KNX0095)	KNX2293
Universal Upper Geometry (M4)	Stainless Steel		KNX0095

3 Probe Pack for Texture Analysis (KNX2293)
with Universal Upper Geometry M4 (KNX0095)

Texture Analysis

- Vertical three point bending and brittleness tests

Disposable Plates

The disposable plate system is a perfect solution for studying samples that cure or set during testing such as thermosets, adhesives and paints. Both upper and lower disposable plates are available in various sizes and are easy to remove and dispose of following a measurement. Stainless steel (316 Grade) lower plate mount and clamp designed for optimized thermal properties and mechanical alignment. The disposable plates feature quick-connect engagement and release mechanism and the lower plate includes a solvent trap cover location ring.

Disposable Plate System (KNX2155)

Disposable Lower Plates (KNX2204)

Disposable Plates

- Rheology of thermosets
- Curing and adhesive testing
- Corrosive and abrasive samples
- Enables safe disposal of toxic and biohazard samples

Torsion/DMA System

The Kinexus Torsion/DMA system is designed to work with the concentric cylinder cartridge system allowing solid samples (e.g. final product) to be tested directly. The system extends the current characterization capabilities of the Kinexus, allowing mechanical properties and material transitions to be evaluated as a function of time, temperature, stress and strain, in both dry and wet environments. This system is suitable for a self-supporting rectangular or cylindrical solid sample. Applications include measurement of composites, polymer strips or even asphalt cores through to composites in a dry or wet temperature controlled environment. Sample Dimensions are up to: Rectangular 50 mm (Height) x 15 mm (Width) x 15 mm (Depth), and Cylindrical 50mm (Height) x 25 mm (Diameter) using appropriate disposable plate or end cap. The actual achievable sample temperature depends on the respective application.

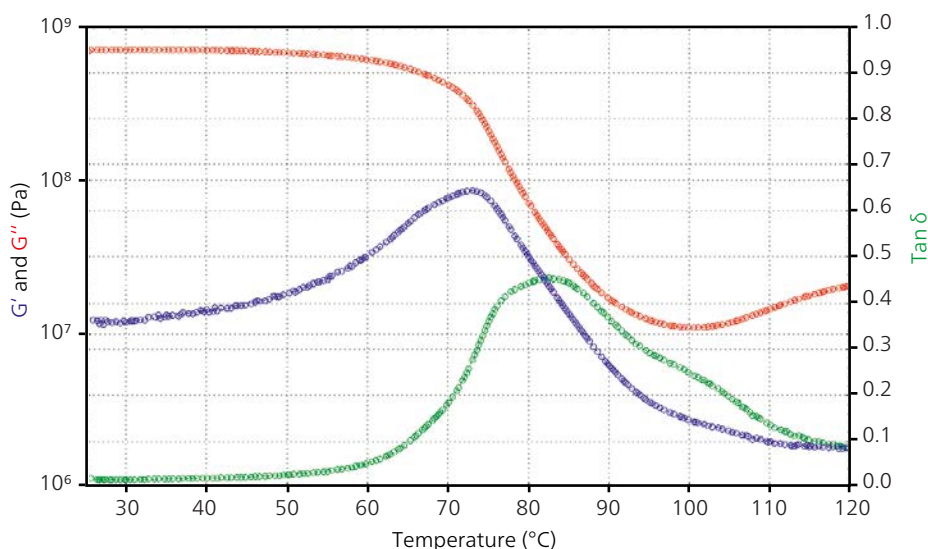

Torsion/DMA System incl. Alignment Jig		
Set comprises	Remarks	Order Number
Torsional fixtures, alignment jig (KNX2249), 10 disposable cylindrical sample end caps for use with max. sample diameter of 13mm (KNX4024), Thermal cover, digital caliper, torque screwdriver and a set of clamp spacer.	Cartridge Compatibility: KNX2002 and KNX2002-E	KNX0158

Solid fixtures accessory

- Measure torsional stiffness
- Measure moisture/solvent absorption with time
- Control temperature dry/wet and oscillation parameters

Temperature sweep of a polymer blend (PLA/PCL) using the Torsion/DMA system.

Tribology

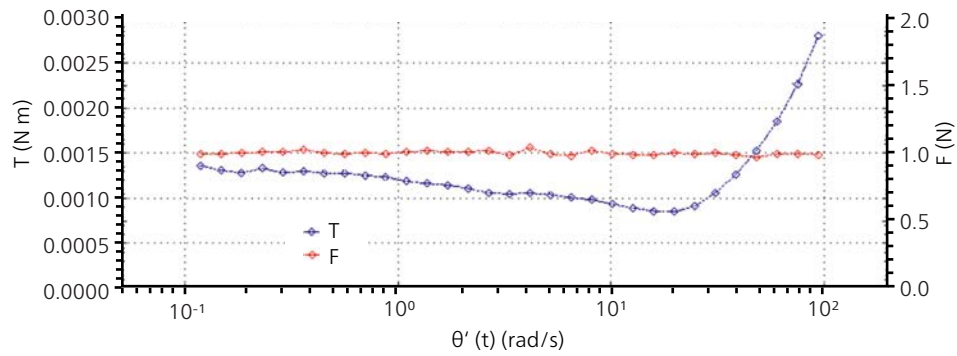

Tribology is the study of friction and lubrication between interacting surfaces in motion. This tribology accessory is designed to investigate the lubricating properties of a sample by measuring the friction (torque) under a constant applied normal force. It can also be used to determine the wear of different materials. Stainless steel (316 grade) upper and lower geometry design. Removable and replaceable wearing components. Alternative materials (such as Aluminum, PP, HDPE and hydroxyapatite (bone)) may be available on request.

Accessories for Tribology

Name	Remarks	Order Number
Tribology cell	Cartridge Compatibility: KNX2001, KNX2001-E, KNX2007-X and KNX2007-E (with hood open)	KNX2281

A comparison of three different priced engine oils, with three repeats of each type. The cheapest oil exhibits a higher torque (and therefore friction) than the most expensive oil.

UV Curing System

UV-curable materials are widely used in coatings, adhesives, and dental compounds. When these materials are exposed to UV radiation, a fast cross-linking reaction occurs, typically within less than a second to a few minutes. Rheometers are used to monitor the curing process and measure the modulus change of the material.

The Kinexus Optical Cell utilizes the open base designs of the Kinexus platform and cylinder cartridge (KNX2002) enabling the required optical train to be used when shear is applied to the material.

The Kinexus UV curing system enables the rheological properties of a UV-curing material to be monitored over time during the application of UV light. The rSpace software includes an intuitive interactive guide automatically employed for when operating the UV curing accessory. UV light intensity can be controlled and programmed within the software.

Kinexus Optical Cell Mechanics

Comprises	Remarks	Order Number
Optical plate insert with two removable Quartz Glass plates (KNX5009) with >90% transmission over 270-2000 nm, solvent trap cover location ring and lower reservoir, customizable/removable insert sleeve to fit custom components. UV-Curing System

- Track the cure properties of samples with varying UV intensity, film thickness, time and temperature
- Safe and enclosed automated exposure cell
- Software controlled light source

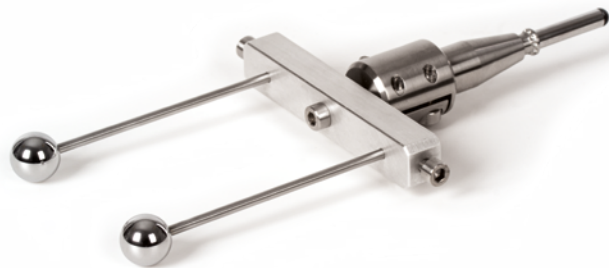

Comparison of different color gels. Curing is initiated when the UV light is applied (blue) and complex modulus data is monitored over time.

Twin Orbital Ball

The twin orbital ball geometry is designed for measuring large particulate samples such as cements and slurries.

Twin Orbital Ball

- Measure start up stress
- Measure flow properties of large aggregate mixes

Twin Orbital Ball

Twin Orbital Ball		
Material	Remarks	Order Number
Stainless Steel	Cartridge Compatibility: KNX2001, KNX2001-E Recommended to use with Cup 80mm Diameter for Plate Cartridge (KNX0135); Can also be used with own cups and the Universal Container Holders	KNX2525

Crumb Rubber Kit

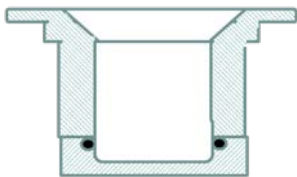

The crumb rubber kit consists of a shallow hard-anodized Aluminum cup for use with the Kinexus cylinder cartridge and is designed to measure crumb rubber asphalt mixtures. It is a low volume, wide gap concentric cylinder enabling samples with larger particles to be measured for more accurate testing.

The crumb rubber cup is typically used with KNX2042, a C14 Bob (14 mm diameter), providing a 6.75 mm working gap. The tapered, funnel opening, makes sample loading and cleaning easier while the shallow, low volume cup, permits a faster and more stable time to thermal equilibrium with minimal thermal gradients. The removable Snap-On base enables easy cleaning.

Optionally, the crumb rubber cup can be used with up to a 25 mm bob or short vane fixtures.

Crumb Rubber Kit (KNX2230)

Crumb Rubber Kit		
Name	Remarks	Order Number
Crumb Rubber Kit	Cartridge Compatibility: KNX2002 and KNX2002-E Recommended to be used with upper fixture KNX2042 and/or KNX2239 and/or KNX2088	KNX2230

Crumb Rubber Kit

- Designed for measuring the rheology of rubber modified asphalt blends
- Excellent thermal insulation
- Temperatures up to 200°C

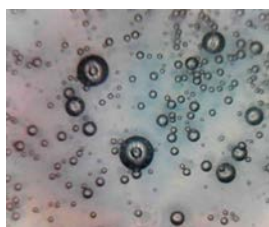

Rheo-Microscope

The Rheo-Microscope allows users to research the rheology of a sample while simultaneously viewing the microstructural changes occurring. It can be used to see particle agglomeration and dispersion under varying shear conditions, or to see an emulsion ripen with time at elevated temperature (providing the contrast between the particles and matrix are significant and size exceeds $\sim 5\mu\text{m}$).

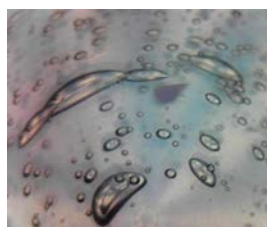

The microscope is mounted underneath a quartz plate (directly below the sample) allowing processes such as the break-up of emulsion droplets, alignment of particulates or fibres in a flow field and/or imaging of shear flow or shear banding within a sample.

The UV/Visible Transparent Borosilicate Glass plate used with the UV Curing System can also be configured with a microscope to allow microstructural changes to be observed during rheological testing.

ELONGATION & DEFORMATION OF BUBBLES

Key Features

- Adjustable radial position – to enable imaging at various shear positions
- From centre position to outer edge of plate
- Adjustable axial position for focal plane control
- Monitor shear banding (sample dependent)
- Temperature control from the cylinder cartridge
- Allows for the sample temperature to remain consistent during measurement
- Quick release mechanism to allow optics to be removed for post-imaging high temperature measurements where the electronics would limited the maximum testing/imaging temperature

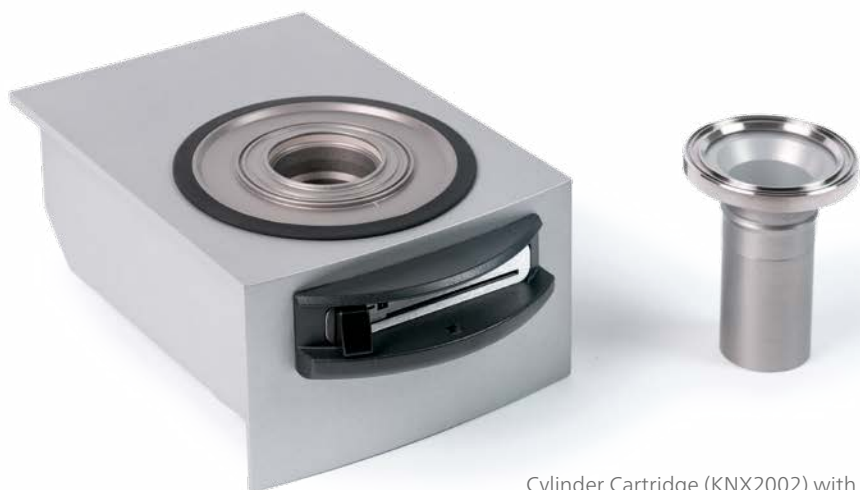

By taking advantage of the modular design of Kinexus, a microscopy accessory can be attached to the Kinexus optical plate providing imaging of samples under shear.

With a magnification of up to 200x, recording at up to 30 fps and a maximum resolution of 1600 x 1200 pixels, details of material structure can be seen under shear and rest conditions (sample dependent).

For example, investigations into the onset of shear thinning and correlation to deformations in the bulk material structure can be made.

Rheo-Microscope

- View, photograph & video your sample while measuring the rheology
- Observe structural changes of emulsions & dispersions under varying shear & temperature conditions

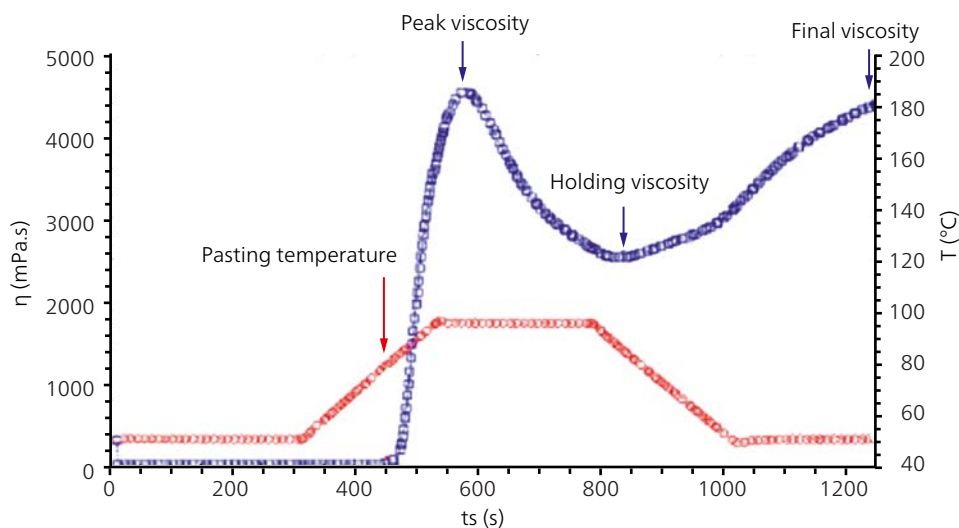

Cylinder Cartridge (KNX2002) with
Optical Cell Mechanics (KNX5008)

Rheology of Dispersions – Starch Pasting Cell

Starch is commonly used in food processing – when it is dissolved in water it can be used as a thickener or stiffening agent.

The Kinexus rheometer can monitor the changes in viscosity of the sample as the starch dissolves, however the challenge is to keep the starch granules suspended and mixed. The Kinexus starch paddle and analysis in rSpace provides starch paste variables such as peak viscosity, holding viscosity and final viscosity.

Starch Pasting Cell – Upper Geometry Set		
Material	Remarks	Order Number
Stainless Steel shaft	Removable & reusable propeller (5 paddles) Cartridge Compatibility: KNX2002 and KNX2002-E	KNX2238

Starch System (KNX2238) with C34 Cup (KNX2526)

- Pasting Temperature
- Temperature at which the starch starts to dissolve
- Peak Viscosity
- Highest Viscosity where all of the starch has dissolved, before breaking down under shear
- Holding Viscosity
- The viscosity after the constant shear, breaking down the associated structure
- Final Viscosity
- Viscosity of the paste after cooling

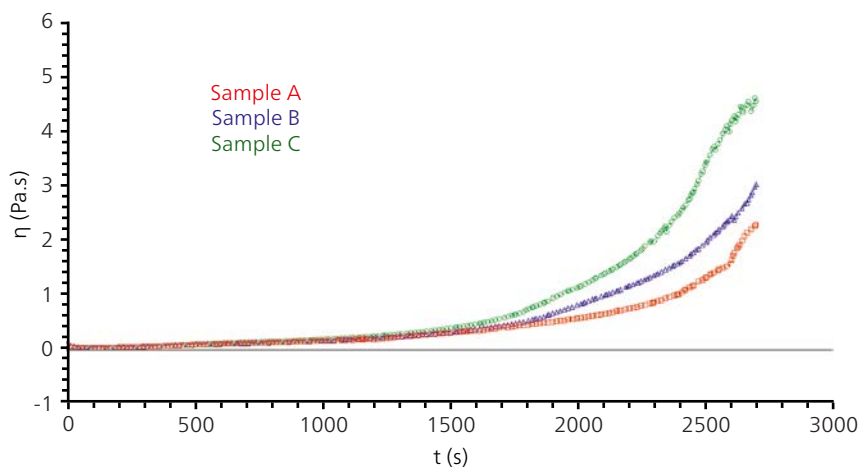

Starch Pasting Cell

- Analysis of starch pasting and gelatinization behavior in a controlled environment (ICC 162 standard)
- Dispersion and testing of starch and rice flour powders according to AACC international, ICC, RACI and PRC standard methods.
- Full temperature, shear rate, stress, speed and gap control

Rheology of Dispersions – Twin Dispersion Paddle

The twin dispersion paddle is designed to be used for materials prone to sedimentation or multi-part systems requiring mixing. The upper shaft is insulated with PEEK in order to prevent heat flux during mixing at higher temperatures. In order to optimise mixing, the 22.5 paddle should be used in conjunction with a C25 DIN cup. Roughened and splined versions of these cups are also available to aid in the prevention of slippage.

Twin Dispersion Paddle		
Material	Remarks	Order Number
Stainless Steel and PEEK	22.5 mm to be used with a C25 cup Cartridge Compatibility: KNX2002 and KNX2002-E	RHR000KIA55.000-00

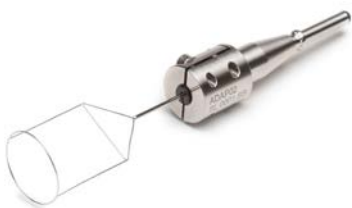

PMMA powder dissolving in MMA liquid to observe the dissolution time. The effect of MW and MWD of the polymer, temperature and shear rate on the dissolution time can be determined. We can see that sample C dissolved at a faster rate, whilst sample A was slowest.

Du-Nouy Ring

The Du-Nouy ring can be used for measuring the surface tension, surface rheology and interfacial rheology of materials with strong interfaces, i.e. the interface between two immiscible fluids such as oil and water. A standard Du-Nouy ring is used in combination with the low inertia design and low torque sensitivity of the Kinexus motor to allow for the most sensitive measurements on a rotational rheometer.

Du-Nouy Ring		
Material	Remarks	Order Number
Platinum iridium	Requires Custom Geometry Adapter (KNX2174) Cartridge Compatibility: KNX2001, KNX2001-E if using Cups for Plate Cartridge with diameters 37mm (KNX0134), 50mm (KNX0127) or 80mm (KNX0135) KNX2007-X and KNX2007-E if using Cups for Plate Cartridge with diameters 37mm (KNX0134) or 50mm (KNX0127) KNX2002 and KNX2002-E if using C25 or C37 cup	KNX4041

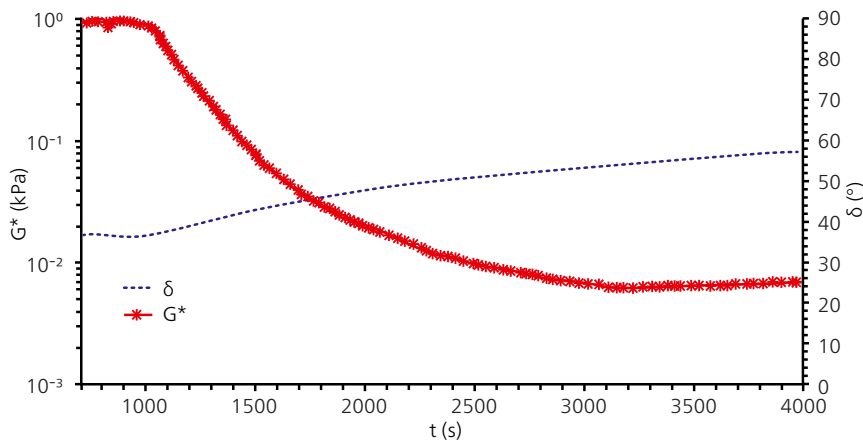

Du Nouy Ring (KNX4041) with Custom Geometry Adapter (KNX2174)

50 mm diameter cup (KNX0127)

37 mm diameter cup (KNX0134)

The example data shows the evolution of an interface of crude oil and water in the presence of an additive/surfactant.

Du-Nouy Ring

- Measure surface tension and the surface rheology of a liquid
- Determine surface changes with varying shear, temperature and time

Interfacial Rheology – Bi-Cone

The bi-cone is used for testing the interfacial rheology of materials. It incorporates both a cone on the under-neath and top of the measuring interface, and is designed to measure the rheological properties at the interface between two immiscible fluids.

Bi-Cone		
Material	Remarks	Order Number
Stainless Steel	42.5 mm diameter with a 5° cone Cartridge Compatibility: KNX2001 and KNX2001-E if using Cup for Plate Cartridge with diameters 50mm (KNX0127) or 80mm (KNX0135) KNX2007-X and KNX2007-E if if using Cup for Plate Cartridge with diameters 50mm	KNX0126

Bi-Cone (KNX0126)

Bi-Cone

- Measures interfacial rheology phenomena between immiscible liquids or liquid/air interfaces
- Determine interfacial rheology changes with varying shear, temperature and time

Immersion Cell

The immersion cell allows samples to be tested with a cone or plate while fully immersed in a buffer or solvent. Samples (such as hydrogels or biological tissues) can be immersed in a liquid, allowing measurements to be conducted to simulate in-vivo or fully immersed conditions.

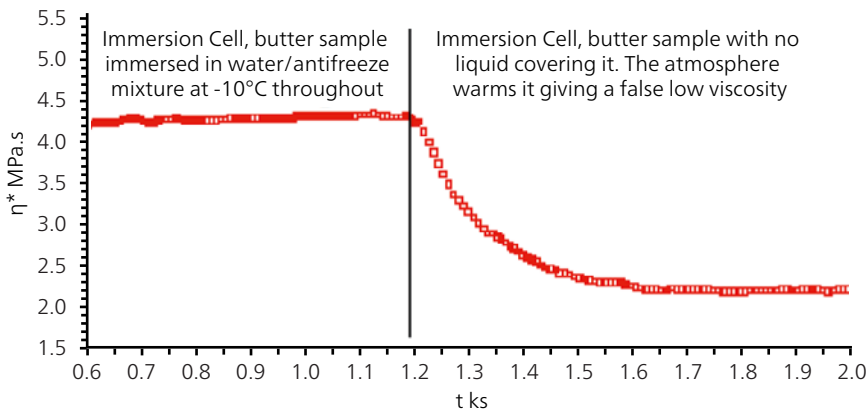

Immersion Cell		
Material	Remarks	Order Number
Stainless Steel	Cartridge Compatibility: KNX2001, KNX2001-E, KNX2007-X and KNX2007-E (only with open hood)	KNX2333

Immersion Cell (KNX2333)

Immersion Cell

- Allows samples, e.g., hydrogels and tissue samples, to be tested while immersed in water or buffer
- Prevents drying
- Controls temperature, ionic strength and can simulate in-vivo situations

The effects of immersing a sample under a liquid for enhanced temperature control. The change of complex modulus is monitored with time. Similarly a sample could be initially tested dry and then under a solvent to determine dissolution time, etc.

Immobilization Cell

The Kinexus immobilization and dehydration cell enables standard rheological testing to be performed whilst the sample is dried. These measurements are valuable for the evaluation of paints and paper coatings, for example. A vacuum is applied beneath a sintered/porous lower plate drawing liquid away through a substrate paper from the sample over time, while simultaneously shearing the sample. While dewatering tests are easy to conduct in a stationary filter funnel, paper coatings require shear during this test, as platy clays and other high aspect ratio materials align differently when sheared, hindering saturation of the base layer.

Immobilization Cell		
Name	Remarks	Order Number
Immobilization Cell	Cartridge Compatibility: KNX2002 and KNX2002-E	KNX0140

Immobilization measurements are made to determine the effects of:

- Solids content
- Porosity of the coating substrate
- thickness of the coating substrate
- Water retention additives
- Applied pressure drop

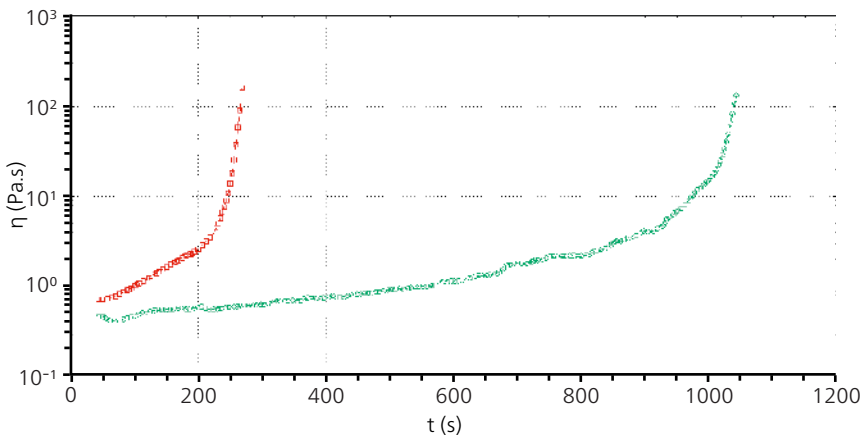

Immobilization Cell (KNX0140)

Features/Specifications

- Can be used with plates and cones up to 45 mm diameter
- Applied pressure drop – Up to 100,000 Pa (1 bar) depending on pump used
- Range of porous and sintered substrates
- Measures all rheological properties
- Can be used with a standard solvent trap system

Immobilization Cell

- Measures dewatering time of a sample during shear
- Determine effects of particle shape
- Measure effectiveness of surface sizing
- Simulate coating processes

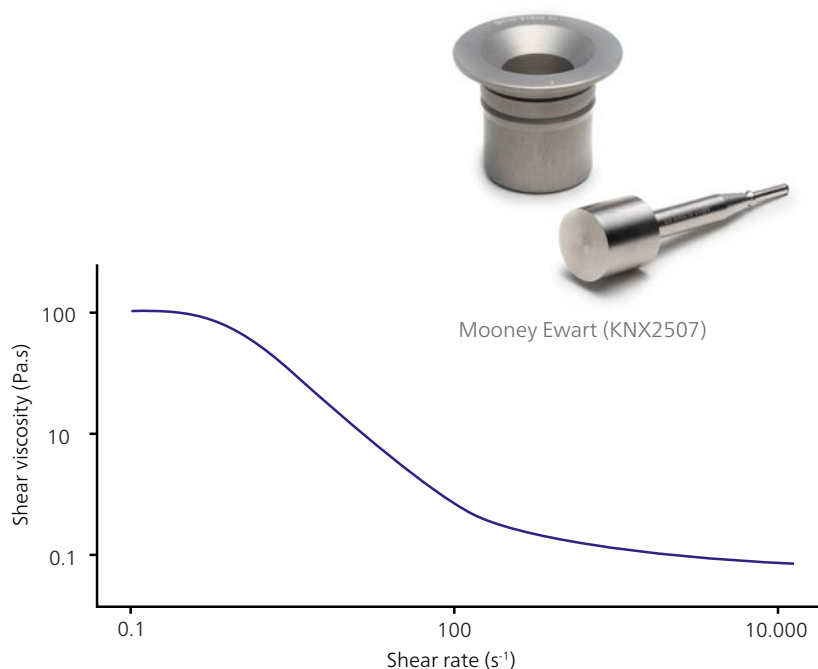

Viscometry measurements using the immobilization cell on coating slurries. Unsized paper samples (red) and sized paper samples (green). The sized paper has a significantly longer water retention time than unsized paper.

Mooney Ewart

The Mooney Ewart features a conical bottom on the upper bob geometry. Incorporating a cone on the upper geometry enables the shear rate at the bottom of the bob to match that on the sides, between the bob the cylinder to enable absolute viscosity measurements. The measuring system for Kinexus has a focus on small sample volumes and high shear rates.

Mooney Ewart					
Diameter (mm)	Cone Angle (°)	Surface Finish	Material	Remarks	Order Number
1.0 ml Cup, 25 mm bob	2	Smooth	Stainless Steel	Cartridge Compatibility: KNX2002 and KNX2002-E	KNX2507
1.5 ml Cup, 25 mm bob	2	Smooth	Stainless Steel	Cartridge Compatibility: KNX2002 and KNX2002-E	KNX2516
2.0 ml Cup, 25 mm bob	2	Smooth	Stainless Steel	Cartridge Compatibility: KNX2002 and KNX2002-E	KNX2517

Mooney Ewart

- The Mooney Ewart adaption is used to measure yield stress and viscosity flow properties. It applies a uniform shear history to the sample and controls shear stress and shear rate temperature.

The Mooney Ewart configuration is a special cup and bob, or coaxial cylinder, measuring system for Kinexus which has a focus on small sample volumes and high shear rates.

The advantages of this cell is that it is considered an “absolute” geometry as a uniform shear rate is applied to the sample (unlike that applied by a conventional DIN53019 cup and bob system). The uniform shear rate is achieved by matching the shear rate from the cup and bob vertical walls, with that of a cone and plate system at the end of the bob. In comparison to standard cup and bobs, the measuring gap for a Mooney Ewart system is relatively small, therefore higher shear rates can be achieved. In addition, the smaller measuring gap requires a lower sample volume, particularly important for valuable materials or those produced in limited quantities.

Expertise in Service

CLOSE TO OUR WORLDWIDE CUSTOMERS

Our Expertise – Service

All over the world, the name NETZSCH stands for comprehensive support and reliable service, before and after sale. Our qualified personnel from the technical service and application departments are always available for consultation.

In special training programs tailored for you and your employees, you will learn to tap the full potential of your instrument.

To maintain and protect your investment, you will be accompanied by our experienced service team over the entire life span of your instrument.

Our Expertise – Application Laboratories

The NETZSCH Thermal Analysis applications laboratories are a proficient partner for nearly any thermal analysis and rheological issue. Our involvement in your projects begins with proper sample preparation and continues through meticulous examination and interpretation of the measurement results. Our diverse methods and over 30 different state-of-the-art measuring stations will provide ready-made solutions for all your thermal needs.

Within the realm of thermal and rheological analyses and the measurement of thermophysical properties, we offer you a comprehensive line of the most diverse analysis techniques for materials characterization.

Measurements can be carried out on samples of the most varied of geometries and configurations. You will receive high-precision measurement results and valuable interpretations from us in the shortest possible time. This will enable you to precisely characterize new materials and components before actual deployment, minimize risks of failure, and gain decisive advantages over your competitors.

The NETZSCH Group is an owner-managed, international technology company with headquarters in Germany. The Business Units Analyzing & Testing, Grinding & Dispersing and Pumps & Systems represent customized solutions at the highest level. More than 4,000 employees in 36 countries and a worldwide sales and service network ensure customer proximity and competent service.

Our performance standards are high. We promise our customers Proven Excellence – exceptional performance in everything we do, proven time and again since 1873.

When it comes to Thermal Analysis, Calorimetry (adiabatic & reaction), the determination of Thermophysical Properties, Rheology and Fire Testing, NETZSCH has it covered. Our 60 years of applications experience, broad state-of-the-art product line and comprehensive service offerings ensure that our solutions will not only meet your every requirement but also exceed your every expectation.

Proven Excellence.■
